

What Do You Want From Your Trailer?

- Value for money
- Longevity
- Less Rust
- Better Design
- Good resale value
- Less maintenance
- Durability
- Solid Build

We choose Zinc Anneal sheeting to provide all of this for you. Most other manufacturers use the standard mild steel as it is cheaper and they know you will be needing a new trailer in a few years.

We are in business to make only the highest quality trailers using the highest quality steel and components.

Zinc-Coated steel provides the most effective way of protecting the steel from corrosion. It also provides improved paint ability.

All Trailers Are NOT the Same

Few basic checkpoints to ask when comparing....

- Do you use Zinc Anneal sheeting for the body of the trailer?
- Do you use etch primer before painting?
- Do you solder your wires to avoid clips coming loose on the roads?
- Do you use RHS cross members on ALL trailers or angle iron?
- Do you have front and rear steps of your standard design?
- Do you run your wire through a tube under the trailer for protection?
- Do you fit LED lights as standard?
- Do you fit 40mm solid 1 tonne axle and springs as standard?
- Do you do a swing tailgate as standard?
- Do you fit anti rattle latches for theft protection and reliability?

These are just a few points that is standard practice at Southern Cross Trailers!
